

One just needs to know how to help oneself

The electricity cables for the transmission station in Abancay have to overcome a distance of 700m. The concrete masts are extremely heavy. At some locations a crane can help setting up the masts, while at others, where no lorry can drive up to, a winch takes over that role. Click on the above picture to see how that works.

The concrete masts are being shifted from a horizontal to a vertical position

Where a lorry has access a crane can help.
